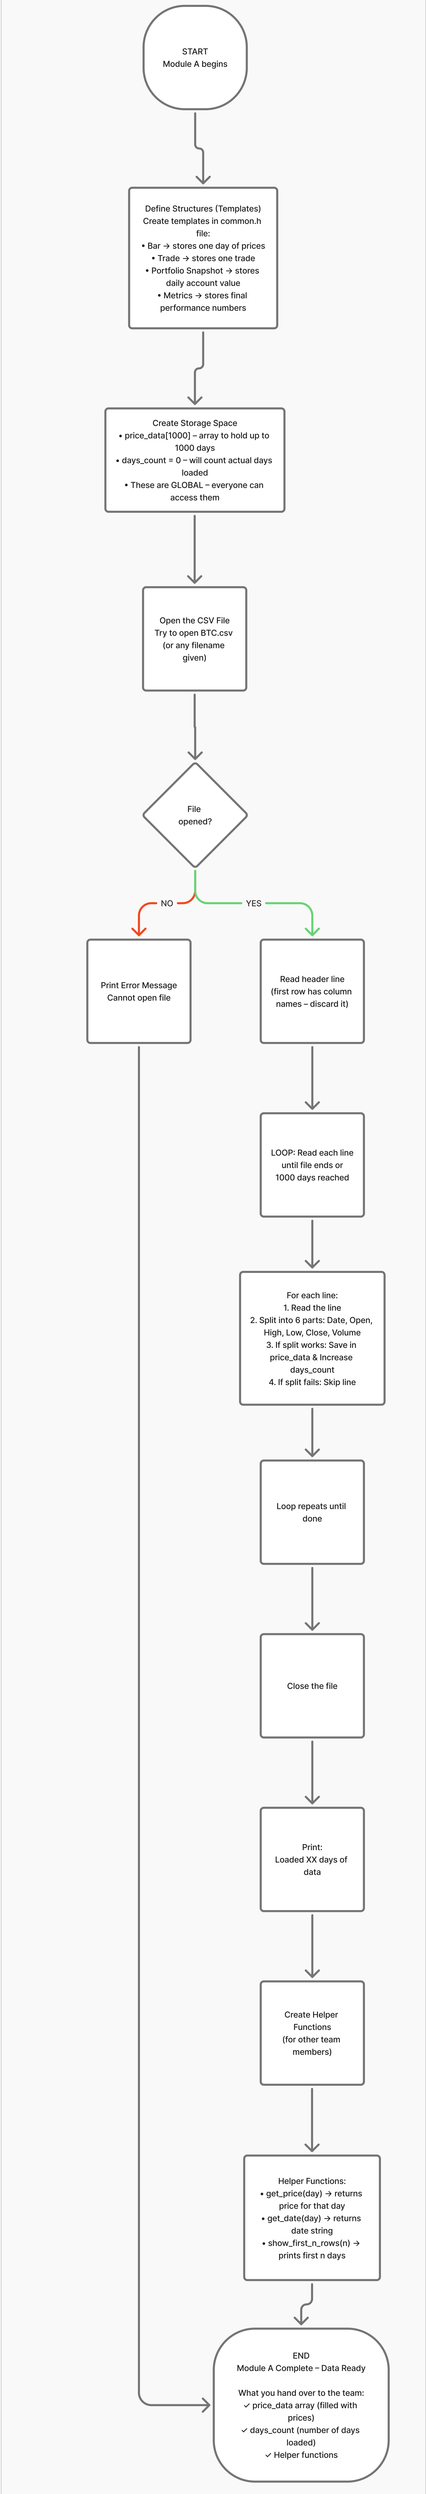
Flow chart



START
Module A begins
Define Structures (Templates)
Create templates in common.h file:
• Bar → stores one day of prices
• Trade → stores one trade
• Portfolio Snapshot → stores daily account value
• Metrics → stores final performance numbers
Create Storage Space
• price_data[1000] – array to hold up to 1000 days
• days_count = 0 – will count actual days loaded
• These are GLOBAL – everyone can access them
Open the CSV File
Try to open BTC.csv (or any filename given)
File opened?
NO
YES
Print Error Message
Cannot open file
Read header line
(first row has column names – discard it)
LOOP: Read each line until file ends or 1000 days reached
For each line:
1. Read the line
2. Split into 6 parts: Date, Open, High, Low, Close, Volume
3. If split works: Save in price_data & Increase days_count
4. If split fails: Skip line
Loop repeats until done
Close the file
Print:
Loaded XX days of data
Create Helper Functions
(for other team members)
Helper Functions:
• get_price(day) → returns price for that day
• get_date(day) → returns date string
• show_first_n_rows(n) → prints first n days
END
Module A Complete – Data Ready
What you hand over to the team:
✓ price_data array (filled with prices)
✓ days_count (number of days loaded)
✓ Helper functions
